

BookDirectory

The purpose of this project is to create a simple Book Directory System. The system will store information about books and friends and allow the user to create, read, update, search and delete them.

Script Execution

When the script is run, the following should occur.

Upon running The script, the user should be presented with the following menu:

The user then enters a one-character action (Digit), leading to one of the Following.

1: Storing Book:

1. Input book name and friend name from the user
2. Store the book in the booklist directory and friends named file directory.
3. Add a log of adding, into queries.log file with date.

2: Search Book:

1. Input the book name
2. Search the book name
3. Print the friend name whom has the book

3: Deleting Book:

1. Input book name
2. Delete the name
3. Add a log of deleting, into queries.log file with date
